Abstract
Funded by EU research grants, some new climate service activities are developed at the European Climate Assessment & Dataset. These new services aim to provide a pan-European perspective on weather and climate-related extremes and contribute to the monitoring of European climate. In the presentation some of these new activities are presented and the representatives of NMHSs are invited to provide feedback on the usefulness of these developments for their own national climate service activities. Additionally, an update is given of the growth of the ECA&D station network and new initiatives related to homogenization of data within ECA&D are discussed.
